Title: WordPress WooCommerce website speed up

Budget: $30

We have an ecommerce website with more than 50 products and the website is custom design along with some fragile backend works. Currently the website's speed on google developer system is 15 for desktop and 17 for mobile versions. You need to speed it up to above 85. You will be working on given subdomain which speed is 50 and 56 for desktop and mobile versions respectively. You will speed up the subdomain first and when it reaches above 85 then it will be under consideration for a week then you will be working on the main website.

Some of the plugins are already used for speeding the website but not much helpful. Also you need to be careful on the css issues and responsive designs as well. Your works must not put any harm on the website's design.

Speed up website, https://developers.google.com/speed/pagespeed/insights/

Referred subdomain: http://lead208.asiancheer.com

You will be paid for both the subdomain and main website, no payment will be processed before the one week test time above 85% on the google speed test. Currently the main website's speed is 16 and 15 for desktop and mobile versions
